Pakistan Technical Registers: Series 8

Indus Basin Irrigation Architecture & National Digital Identity Networks

1. The Indus Basin Irrigation System (IBIS)

The Indus Basin Irrigation System is the largest contiguous irrigation network in the world. It forms the absolute hydraulic backbone of Pakistan's agrarian economy, managing massive water diversion from the Indus River and its major tributaries.

Component / Node	Technical & Operational Specifications
Tarbela & Mangla Reservoirs	Primary structural regulatory storage hubs. Tarbela (on the Indus) and Mangla (on the Jhelum) capture glacial melt and monsoon runoff, acting as the primary flow stabilizers for downstream canal networks.
Main Barrages (Sukkur, Kotri, Taunsa)	Hydraulic diversion structures. Sukkur Barrage alone controls a massive network of 7 primary canals, irrigating millions of acres of fertile land in the Sindh plains via gravity-fed distribution.
Link Canals	Inter-river transfer aqueducts (e.g., Chashma-Jhelum Link Canal). Built to transfer water from the western rivers (Indus, Jhelum) to the eastern river beds (Chenab, Ravi, Sutlej) to maintain equilibrium across all agricultural zones.

2. NADRA Core Biometric & Digital Identity Architecture

The National Database and Registration Authority (NADRA) operates one of the world's most advanced, centralized, integrated biometric citizen identification platforms.

Platform System	Architectural & Cryptographic Infrastructure
National Data Repository	A highly secure, multi-tier data warehouse compiling unique identities for over 120 million citizens. Deploys multi-modal biometrics pairing automated fingerprint identification (AFIS) with facial recognition matrixes.
CNIC / SNIC Microchip Tech	Smart National Identity Cards (SNIC) embed a secure, tamper-proof microchip storing encrypted citizen profile metrics, dual-fingerprint templates, and a unique 13-digit identity string mapped across family trees.
Verisys & Biometric API Gateway	Real-time automated verification engine. Provides digital identity verification APIs to the telecom sector (SIM activation via biometric verification devices), commercial banks (KYC compliance), and the Raast retail payment rail.
